

DRY POWDER POLYMER MIXING & DOSING SYSTEM

TEMS
INTERNATIONAL

One variable speed NE20 mono pump accurately feeding a pre-determined concentration of diluted polymer to the oily feedstock/sludge.

Two 1,000 litre agitated polymer-mixing tanks providing a constant supply of polymer mixed with an agreed concentration and delivered to the system at a pre-determined point.

The polymer will flocculate the fine solid particles to aid the separation process in the decanter and assist in the removal of hydrocarbons from the "waste solids", ultimately producing a dryer cake for disposal and maximising the recovery of good oil which is returned to the client.
