

# RIG VESSEL AUDITS - INDEPENDENT SBM/OBM AUDITS

Getting a rig ready for drilling using synthetic or oil based drilling fluids is a comprehensive process. There are many aspects to consider, from what rubbers are installed in valves, to drill floor fluid containment systems, shock hose requirements, spill procedures and ensuring correct permits are in place to name a few.

TEMS' experience and proven inspection systems can eliminate costly oversights that are difficult to deal with once a rig is mobilised and operating with oil or synthetic based fluids.

TEMS can also manage the pre-project rig fit out process to ensure all necessary steps are taken to ensure your rig has full containment systems in place for the specific drilling environment.
